
Kinematic trigger
$|\Delta x_t|$
abrupt state change
Entropic gate
$H(p_{t-1})$
trajectory instability
thresholds τ_Δ and τ_H calibrated
on validation data
Invest computation if
$\left(|\Delta x_t| \geq \tau_\Delta\right) \vee \left(H(p_{t-1}) \geq \tau_H\right)$
otherwise reuse the emitted probability: $p_t \leftarrow p_{t-1}$
